

CLAIMS

I claim:

A cabbage cutter comprising a hollow, stainless steel, cylindrical shaped body having a closed top and an open bottom with a cutting and chopping means that has a removable protective cover. The cylindrical shaped body and closed top of the cabbage cutter are constructed of stainless steel which makes the cabbage cutter superior in strength and durability, and resistant to corrosion and rusting, and the cylindrical shaped body and closed top have imperforate smooth interior and exterior surfaces. The closed top of the cylindrical shaped body is covered with a permanently affixed cap of suitable molded plastic that extends slightly over onto the cylindrical shaped body of the cabbage cutter that serves as a hand grip so that the person using the cabbage cutter will be able to maintain a good grip on the cabbage cutter to use the device efficiently and effectively at all times. The open bottom rim is filed or rubbed down to a smooth, thin, sharp cutting and chopping means that can be resharpened if it should become dulled from extensive use. The cabbage cutter has a removable protective cover, contiguous with the cutting and chopping means of the hollow cylindrical shaped body, that fits over the cutting and chopping means to serve as a

protective shield from injury, and protects the cutting and chopping means from becoming damaged when the cabbage cutter is not in use or stored. This cabbage cutter is a non-powered, hand operated device developed specifically to cut and chop cabbage. The cabbage cutter is designed and constructed for superior strength and durability and will do an excellent job cutting through the thick stalks and tightly overlapping leaves of cabbage. This cabbage cutter works best when cabbage head is cut in chunks (pieces), placed in a large bowl or container, and then grasping the cap (hand grip) of the cabbage cutter and bringing the cutting and chopping means down repeatedly (an up and down motion) onto the cabbage and cutting the cabbage to desired size.
